Process-without-processor model of noism

This is an idea I got but don't believe in, but still decided to share since I find it interesting. It's a model of my joke theory of noism (about noism: https://archive.org/details/noism_theory).

In this model, which I also call perspectival noism besides the title, the perspective that we have is actually just the process without a processor, happening only as an illusion in the void.

Processes such as seeing aren't real things, in the sense that there's no object called "seeing." There are physical processes carrying out a process, which in itself isn't an actual thing. Hence, it can be said that if these processes could happen nowhere and never as illusions in the void, without a material processor generating them, hence not existing since they aren't actual things, we have a model in which nothing exists despite the illusion of it existing.

Thank you for reading!
